Synopsis

1. Introduction

There has been an increasing need for efficient and user-friendly platforms for symptom submission in hospitals. The current trend of research on healthcare digitalization highlights the importance of seamless patient data collection. Several variants of these algorithms and systems have been developed. The current research aims to study and develop an algorithm that optimizes the collection, storage, and analysis of patient symptoms to improve diagnostic accuracy and patient care. This website will focus on the early detection of widespread diseases by connecting the collected locations to a map.

2. Objective

The purpose of this project is to design and implement a hospital website that allows users to submit their symptoms, which are then saved in a database. This system aims to streamline the process of symptom collection, facilitate better patient-doctor communication, and enhance the overall efficiency of the hospital's diagnostic process.

3. Related work

Previous work related to this project includes various online patient portals and symptom checkers. Studies have shown that digital symptom submission can reduce patient wait times and improve data accuracy. Notable examples include the Mayo Clinic's patient portal and WebMD's symptom checker. These systems have set a foundation, but there is a need for more integrated solutions that directly link to hospital databases for real-time data usage.

4. Proposed Method (if any)

In this section, we propose a method to solve the problem of efficient symptom collection by developing a web-based form that users can fill out to submit their symptoms. This form will include fields for personal information, medical history, allergies, and a checklist of common symptoms. The data collected will be processed and stored in a hospital database, which healthcare providers can access for diagnostic purposes.

5. Methodology

To accomplish our proposed work, we will:

1. Develop a user-friendly web form using HTML, CSS, and JavaScript.
2. Implement form validation to ensure data accuracy.
3. Use Google Apps Script to handle form submission and data storage in a Google Sheet or database.
4. Implement security measures to protect patient data.
5. Test the form with a sample group of users and make necessary adjustments based on feedback.

6. Plan of work

- **Month 1:** Requirement gathering and initial design.
- **Month 2:** Develop the front-end of the web form.
- **Month 3:** Implement back-end data handling and storage.
- **Month 4:** Integrate form with Google Apps Script and ensure secure data transmission.
- **Month 5:** Testing and bug fixing.
- **Month 6:** Final deployment and documentation.
